

Forensic Analysis Report - S25

Student: Yonatan Avitan | **ID:** S25 | **Program:** NX212 | **Class:** 7736/39

1. Code Analysis

The automated script `7736-39.S25.NX212.sh` was developed to streamline the forensic investigation process. It handles environment verification, automated file carving (Foremost/Binwalk), and deep string analysis.

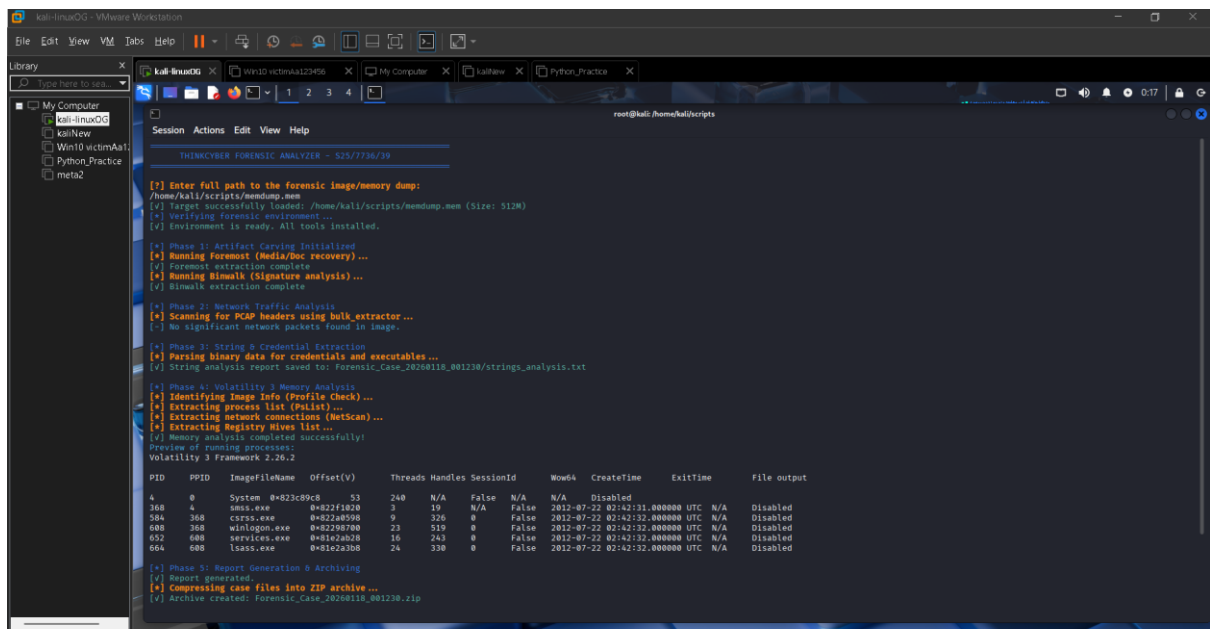

The memory analysis module was specifically designed to utilize the **Volatility 3 Framework** to meet all investigation requirements. It executes the following plugins:

- `windows.info` – To identify image profile information. •
- `windows.pslist.PsList` – For accurate process extraction. •
- `windows.netscan.NetScan` – To identify active network connections. •
- `windows.registry.hivelist.HiveList` – To extract registry hive locations. •

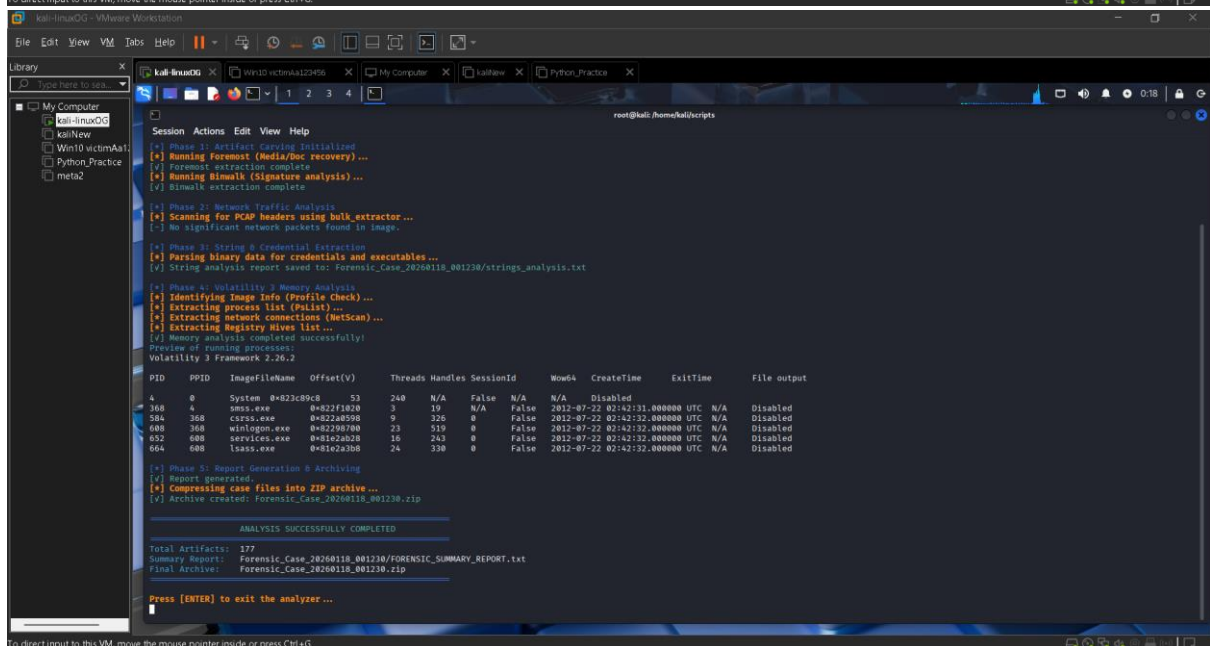

2. Execution Proof

The analysis of `memdump.mem` was completed successfully. A total of **177 artifacts** were recovered and archived in the case directory. The script successfully extracted the process list, network traffic data, and registry information as required.

Note: See attached screenshot below for terminal output verification.
